IN THE CLAIMS:

(Currently Amended) An electrode assembly arranged to carry out a bioelectrical
interaction with an individual, said electrode assembly comprising a conductive material
having a contact surface arranged to be brought into contact with a receiving area of the
individual's skin, said conductive material being electrically connectable to a suitable
electronic device to enable said interaction, characterized in that said electrode assembly
comprises impedance control means arranged to measure and control the impedance of
the receiving area of the individual's skin prior to an event of the bioelectrical interaction,
the impedance control means including a depot of a conductive fluidum and an actuatable
discharge means arranged to discharge said fluidum in a space between the contact
surface and the receiving area.

(Cancelled)

- 3. (Withdrawn) An electrode assembly according to claim 2, characterized in that the contact surface of the conductive material comprises a layer provided with pores, the impedance control means comprising a container with an ignitable pressurized gas arranged to induce a force on said depot in a direction of the pores upon an event of ignition.
- 4. (Currently Amended) An electrode assembly according to claim [[2]] 1, characterized in that the contact surface of the conductive material is formed by a compartment housing said depot, the discharge means comprising a settable fiber located in said compartment and extending in a direction transversal to the contact surface.
- (Original) An electrode assembly according to claim 4, characterized in that the settable fiber comprises an electrostrictive material.
- (Original) An electrode assembly according claim 4, characterized in that the settable fiber comprises a thermoelectric material.

- (Previously Presented) An electrode assembly according to claim 1, characterized in that the conductive material comprises a conductive fabric.
- (Previously Presented) A system for enabling a bioelectrical interaction with an individual, said system comprising an electrode assembly according to claim 1 and a power supply unit electrically connected to the electrode assembly.
- (Previously Presented) A system according to claim 8, further comprising a vital sign
 monitoring means for measuring an electrical signal on the body of an individual.
- (Previously Presented) A system according to claim 8, further comprising a means for inducing an electrical current in the body of the individual.
